Before the next challenge.

My name

Mio

A question I want to resolve

what generative ai do you use?

Recall. Question. Recalibrate.

What have I completed?

I prior artifact I would like to mention is the assignment where we had to create functioning buttons on Visual Studio. I did this with a team but I was the one who created the code and I personally felt that it came out looking cute.

My explanation of classes, objects, data and actions

example in C#: The button click event in my project runs the code that adds an item to the order.
visible result: When I click the button, the selected item appears in the order list.

My questions, answers and remaining uncertainty

How does a button click change the order? The click event runs the C# code that adds the selected item to the cart. Something that can help and did help at that time was the auto debugger on Visual Studio.

My personal GitHub repository URL

https://github.com/miomio08/11B---Mio

Readiness check

I ran my code in Visual Studio and tested the menu, order list, order buttons, and countdown timer. I saved my C# code, XAML design, and food images. I pushed my updated Lov3rs Plaza cafe project to my team's GitHub repository under my personal folder. I checked my repository link to make sure it opens and my project files are there.

Replace Chapters with Pipelines

Attention First, Chapter 3, pp. 37–41 (132-page edition).

What I understand from this chapter

A pipeline is a series of steps that lead to a clear outcome/result. Each step has a purpose in telling the player how to progress further. I also learned that it is important to not rush the Beginning because it is the fundamental of everything else. It starts the whole process.

My opinion and reasons

I agree that each step is equally important because skipping steps can confuse the player. In order to follow the whole process, the player must experience and go through each step.

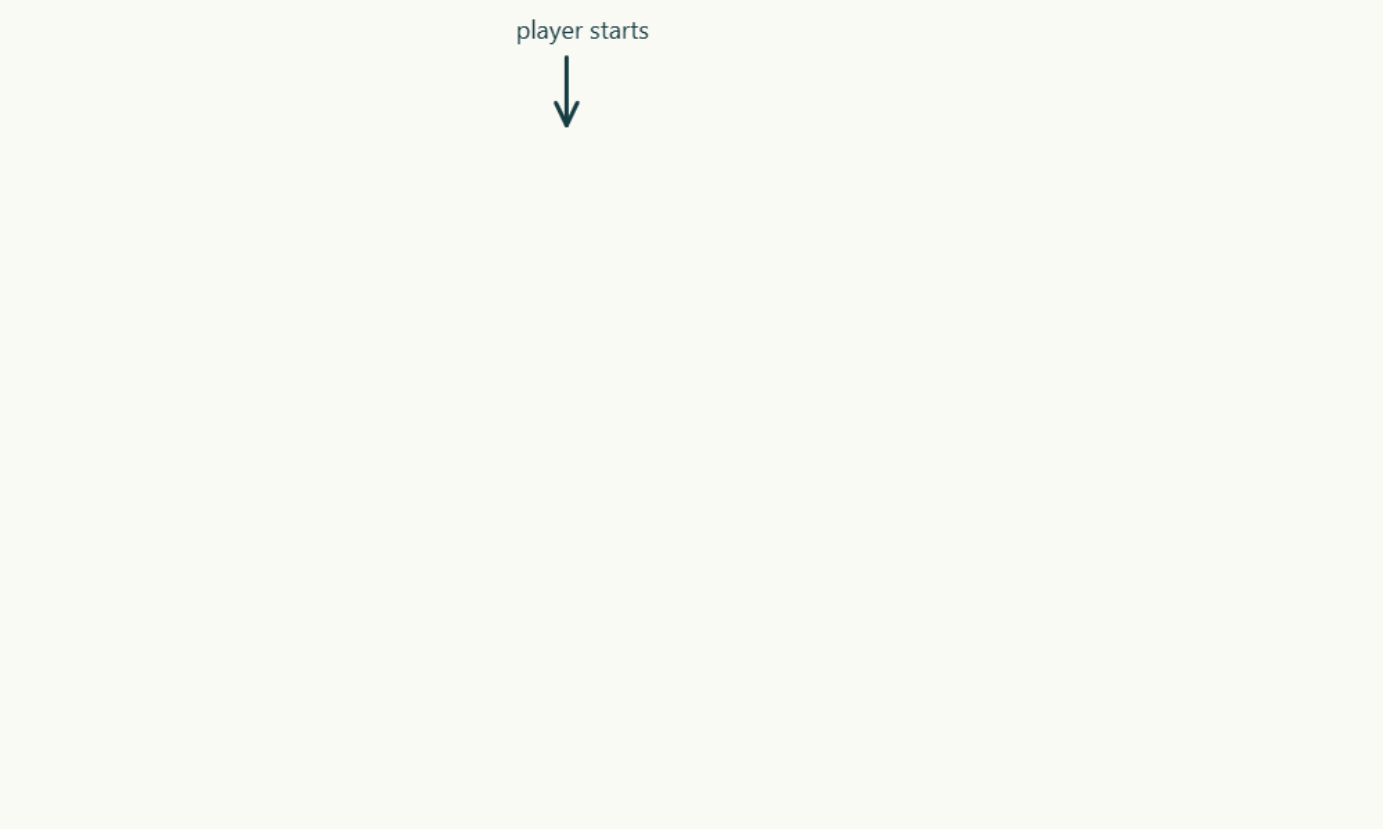

A decision I can apply

Player starts -> players sees an object -> player interacts -> system processes the action -> visible result
Each node needs the previous step to be completed in order to continue.

A question or next investigation

How can I connect different nodes and scripts so the player's actions create clear results?

Personal whiteboard · Mio

No board explanation recorded.

Design for the Attention Economy

Attention First, Chapter 6, pp. 53–58 (132-page edition).

What I understand from this chapter

Attention can be wasted by unclear instructions, distractions, and switching between too many tasks. A clear environment helps people stay focused and make progress.

My opinion and reasons

I think having clear instructions is important because confusion wastes time and makes teamwork harder.

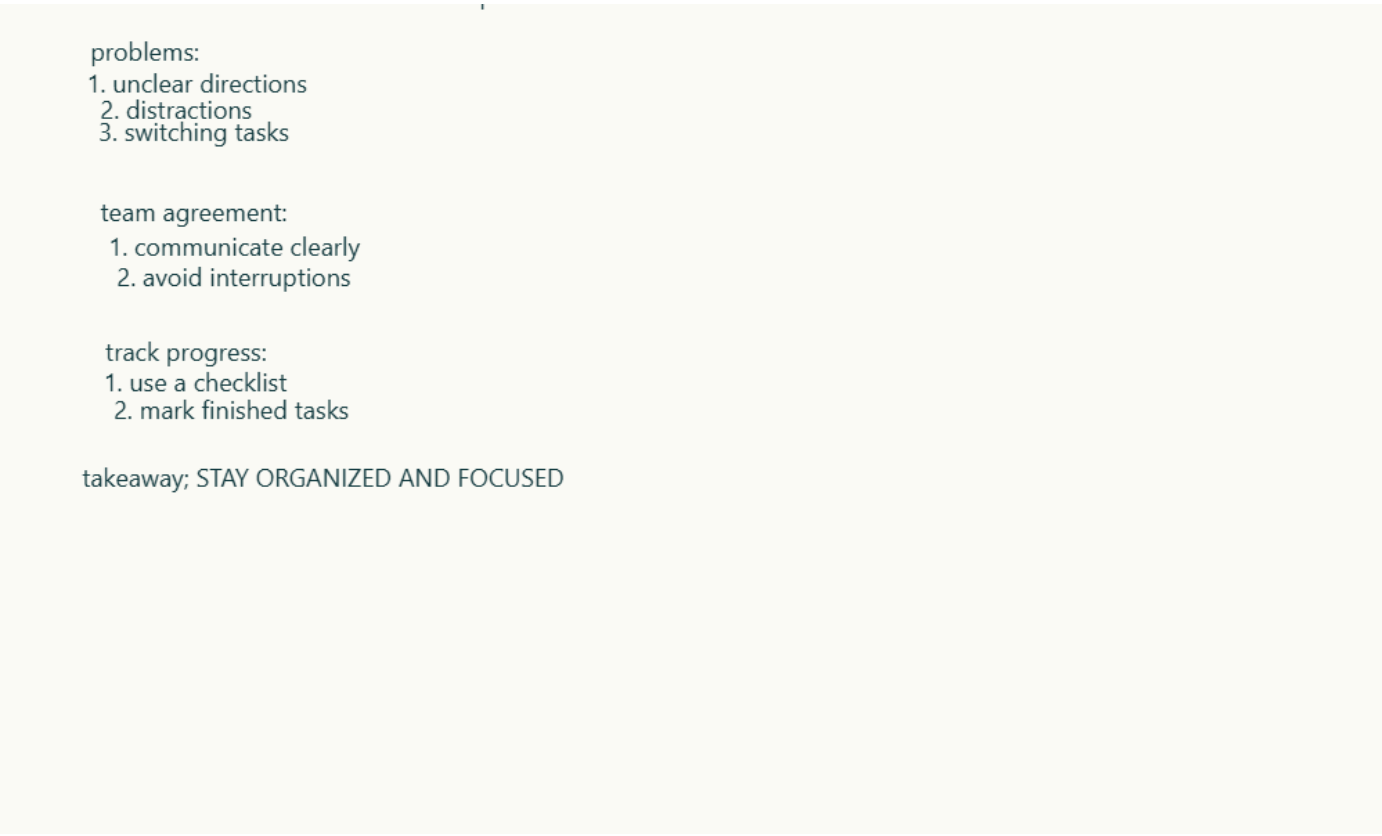

A decision I can apply

I will keep instructions organized, focus on one task at a time, and share progress so everyone knows what has been completed.

A question or next investigation

How can a team avoid distractions while still communicating and helping each other?

Personal whiteboard · Mio

How to stay focused

Identity and the Creator Loop

Attention First, Chapter 7, pp. 61–69 (132-page edition).

What I understand from this chapter

identity is shown through repeated actions, habits, and the standards we choose to follow

My opinion and reasons

I think consistency matters more than being perfect because improvement comes from practice and effort, showing that you care to actually learn and improve

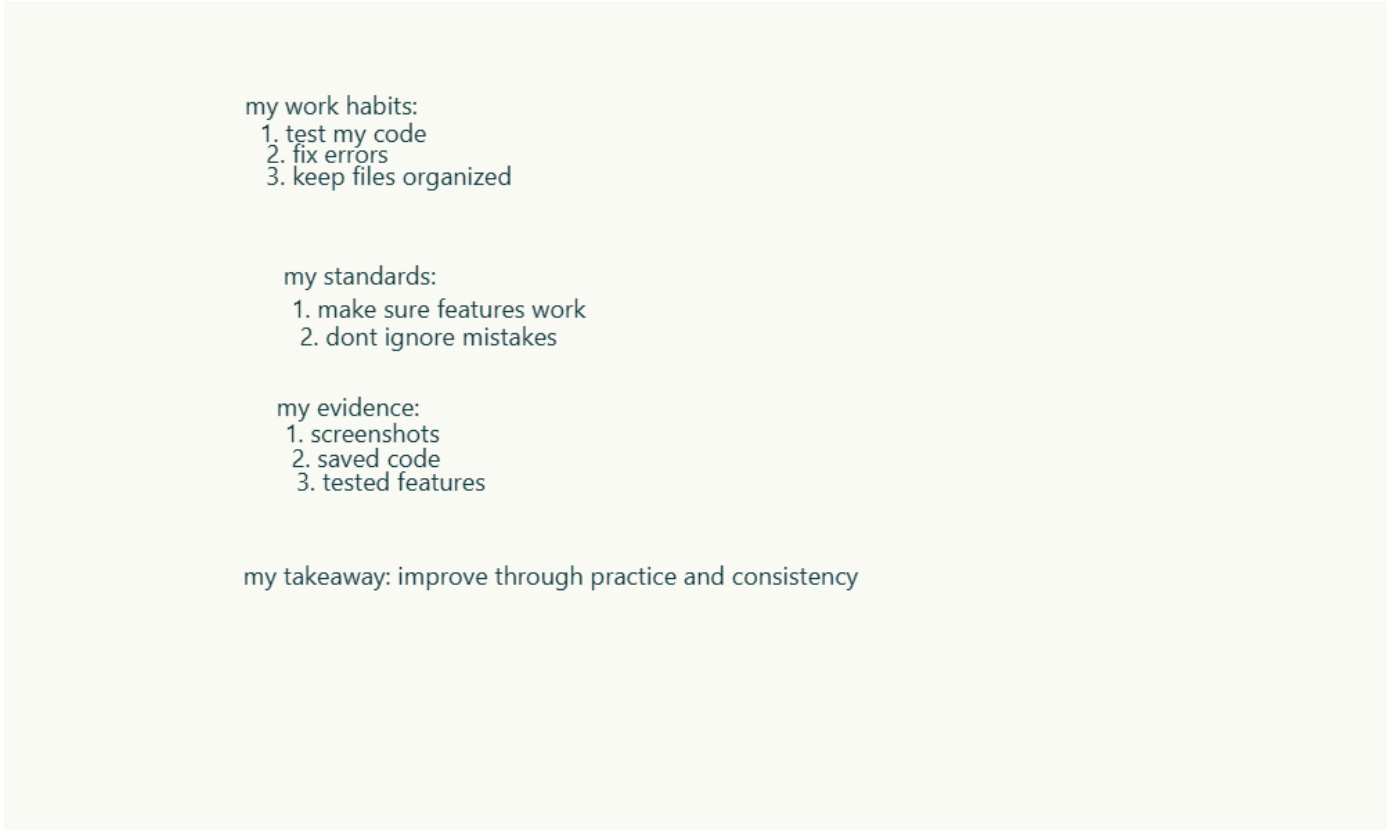

A decision I can apply

I will test my work, fix mistakes, and keep my project organized

A question or next investigation

How can I stay consistent and keep improving even when a project gets difficult?

Personal whiteboard · Mio

No board explanation recorded.

Designing Your Teams and Tools

Attention First, Chapter 8, pp. 71–74 (132-page edition).

What I understand from this chapter

A team needs people and tools with different skills to accomplish its mission. Everyone can contribute in different ways.

My opinion and reasons

I think teamwork works better when people use their strengths and share ideas and actually put in effort.

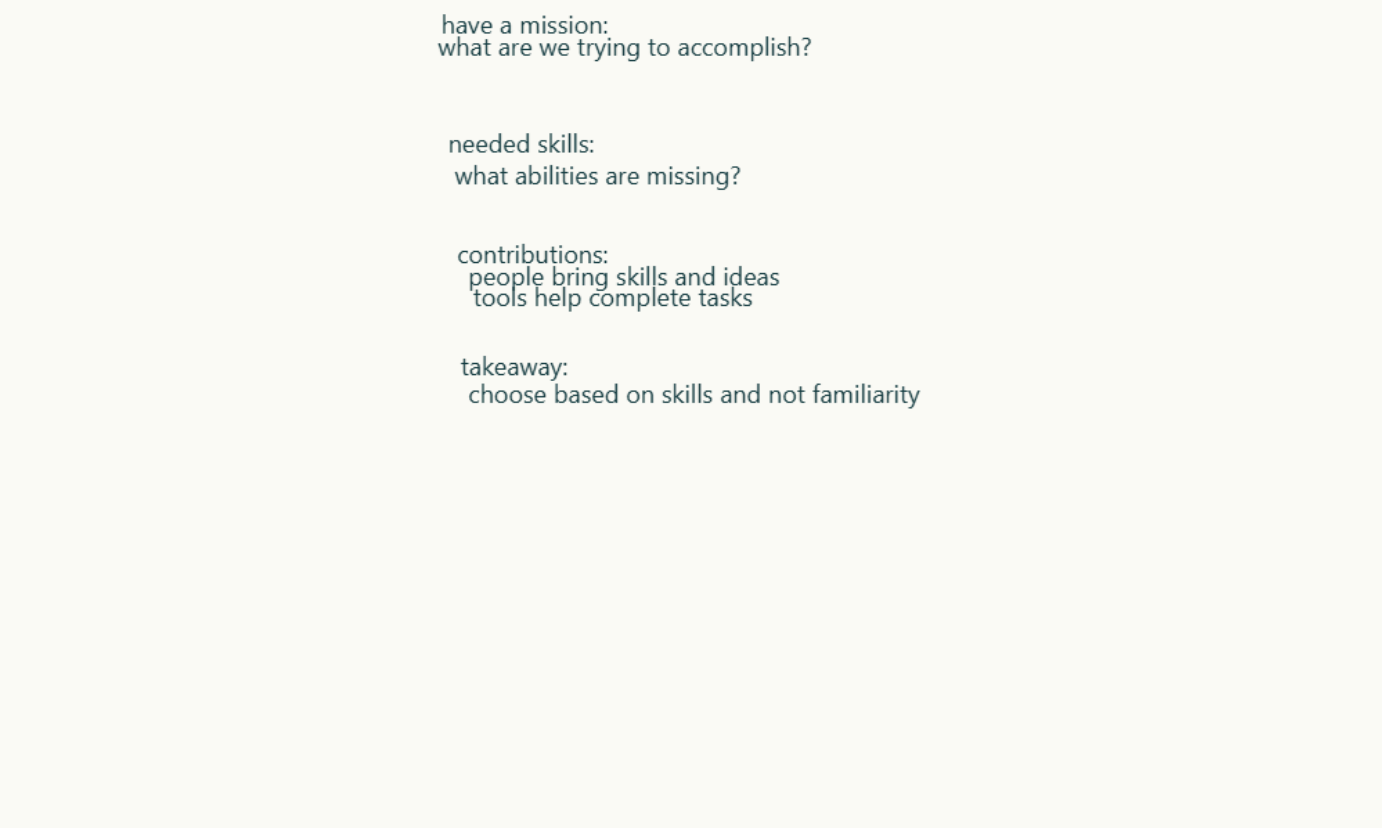

A decision I can apply

I will consider what skills are needed before choosing who or what can help with a project.

A question or next investigation

How can a team make sure everyone's skills and ideas are being used?

Personal whiteboard · Mio

building the right team

The Human Operating System

Attention First, Chapter 11, pp. 93–103 (132-page edition).

What I understand from this chapter

A good plan balances exploring new ideas with staying focused on a clear goal. Being busy doesn't always mean making progress.

My opinion and reasons

I think having a clear direction is important because it helps avoid wasting time on unnecessary tasks.

A decision I can apply

I will focus on the most important features first, test them, and adjust my plan when needed.

A question or next investigation

How can I tell if my work is actually helping me reach my goal?

Personal whiteboard · Mio

planning w purpose

Bring something to the summit.

The connection across the readings

The readings taught me the importance of staying focused, being consistent, working toward a clear goal, and using my skills effectively.

Evidence I am ready to show

My C# code and XAML design, screenshots of my code, tested menu, cart, and order features.

My board in words

My mission is to create a working cafe website called Lov3rs Plaza. I used C# in Visual Code to create the menu and ordering features. My goal is to keep improving the app by testing features and fixing problems.

Personal whiteboard · Mio

Lov3rs Plaza

Choose where you want to go.

My direction

Join a lead

The mission I want to explore

My mission that I would like to explore is creating different things from the ones I have already. I want to work more on websites, such as the cafe one. I enjoyed working on that project and would like to work on similar things in the future. I like the concept of interactive buttons and thought that it was very interesting.

My pitch

My purpose is to work towards creating new, creative projects that also give me the opportunity to explore formatting things to make them look aesthetically pleasing. The evidence I can provide for this is the Lov3r's Plaza website, which is completed and even has a spotify link. The help I would need is coming up with more ideas, such as the menu items and certain code I did not know such as creating buttons. My next action is to improve my code and to get more familiar with it.

Conversations and decisions

I spoke with Jonathan and I realize that his aims are more focused towards creating a Roleplaying game, and, I would say that our views relate because roleplay is strictly based off of creativity and I can connect to that. He is also encouraging towards the other teammates to do their best and I value that trait.
Isaias is good at coding, whereas I am not as skilled as he is, so I would want him on my team. He provides insights that I do not know about and, he also is a good brainstormer and helps in the development stage.
Paul wants to focus more on providing depth to our projects. I would want him on my team because details are always useful. Paul also asks questions about the whole planning, and executing process, making him useful when it comes to brainstorming as well.

Agree on the work.

Team name / solo mission

"Hello World"

Agreed lead / my name if solo

Jonathan

Accepted members and contributions

Paul - Brings good vibes and keeps the team on the task
Jonathan - Keeps the team together and moving forward with the ideas
Isaias - Is fast at getting things done and problem solving
Mio - Creative and composed
AI - our helpful tool and teammate

How the literature strengthens this team

Jonathan is excellent when it comes to keeping everyone's attention on the given tasks. Paul also does this, however, he also provides useful feedback in the beginning stage where we brainstorm on our whiteboard.

Communication and check-in plan

Our work will be on our shared github and we will compare results via Discord and Instagram.

Team GitHub URL, or Working solo

https://github.com/miomi008/11B---Hello-World

Make the Attention Accord.

Purpose and smallest playable result

Game: Sharksweeper
Goal: Find all safe spaces without clicking a shark
Player action: Click a tile
Condition: Check whether the tile contains a shark
Visible consequence: A safe tile reveals a number; a shark ends the game

My attention promise

focus on one feature at a time
test my work after making changes

Time and dependency plan

- Create the game board
- Add sharks and numbers
- Make tiles clickable
- Test winning and losing conditions

Board explanation and contributors

- The player clicks tiles to reveal information and try to win
- Godot and C# are the main tools
- I am completing the project with my team

Translate the mission into code.

My story-to-code map

object: A tile on the game board
data: Whether it contains a shark and how many nearby mines there are
cction: Reveals itself when clicked
system event: A mouse-click input event triggers the action

What I am borrowing and why

- Godot's built-in Sprite2D to display game objects
- Godot's input system to detect player clicks

Object lifetime and responsibility

- the tile exists as part of the game board
- it stores its information and responds when the player clicks it

Make one moment playable.

What I expect to happen

I expect my character to move using the keyboard, approach an object, and interact with it. When I press the interaction key nearby, the object should change color.

What I built and where it lives

engine: Godot 4.7.2 .NET / C#
character: CharacterBody3D
movement: Keyboard controls using Godot's Input Map.
interaction: Press E near a beacon.
visible consequence: The beacon changes color
scene: A new scene in your Godot project.

A difficulty and my response

I previously had trouble with movement and C# errors in Godot. I checked my code, corrected the errors, and tested the changes.

Test what you are claiming.

My test record

I tested the movement, and it does absolutely nothing. I'm realizing that I do not know how to properly code the 3D sprite.

My improvement experiment

Not recorded

Promised versus returned evidence

Not recorded

Return with work you can explain.

My final access and file check
